Abstract –Analysis of research paper will present how we can predict _forest fire spread_ using cellular automata. The analysis plays an essential role in designing quick risk management and implementing effective suppression policies. As a preferable modeling approach, the cellular automaton (CA) has been used to understand the complex mechanisms of fire spreading.

Keywords –

Forest fire: A wildfire or wild land fire is a fire in an area of combustible vegetation that occurs in the countryside or rural area.

Cellular automata: A cellular automaton is a collection of "colored" cells on a grid of specified shape that evolves through a number of discrete time steps according to a set of rules based on the states of neighboring cells. The rules are then applied iteratively for as many time steps as desired.
